

A process inspired by nature
in an attempt to protect it.

Introducing AltelaRain®, a new frac water and produced water desalination technology inspired by nature and now in use in the Marcellus Shale Basin of Pennsylvania. AltelaRain® lowers the cost of oil and gas production while dramatically decreasing the volume of waste water that needs to be trucked away. It purifies the most highly challenged water – including the removal of salts and total dissolved solids consistent with recent regulatory requirements – thereby extending the life of a well. Now your produced water liabilities are clean water assets. Call 505.923.4140 or visit altelainc.com
